## **Logarithmic Function**

General equations:

 $\mathbf{y} = \log(\mathbf{x}) = \log_{10}(\mathbf{x}) = \log \mathbf{x}$  where 10 = base

 $\mathbf{y} = \mathbf{ln}(\mathbf{x}) = \mathbf{log}_{\mathbf{e}}(\mathbf{x}) = \mathbf{ln} \mathbf{x}$ 

 $\mathbf{y} = \mathbf{log}_{\mathbf{b}}(\mathbf{x}) = \mathbf{log}_{\mathbf{b}} \mathbf{x}$ 

where b = base

**Example:**  $y = \log_2(x)$ 

where e = base = 2.718...

**Conversion from one base (a) to another base (b):** 

Start with log<sub>a</sub> x.

Want to **convert this to base b**.

**Formula:**  $\log_b x = \frac{\log_a x}{\log_a b}$ 

**Example :** given  $\log_3 16$ , what is  $\log_{10} 16$ ?

**Answer:** 
$$\log_3 16 = \frac{\log_{10} 16}{\log_{10} 3}$$
